Attenuation Systems

Sustainable Drainage Systems (SUDS) include rainwater harvesting, soakaway and attenuation solutions designed to prevent surface water from entering the existing drainage system or watercourse unchecked. Implementing SUDS contributes significantly towards sustainable developments and planning authorities now expect planning applications to show how a more sustainable approach to drainage is to be incorporated into the development.

attenuation systems function by gradually returning the collected surface water to the environment. They may include a storage element that allows sudden surges of water (such as short, heavy downpours) to be 'stockpiled' and then released to the environment over an extended period. These are, in effect, modern soakaways.
