Channel Drain

Linear drainage refers to systems that drain along their entire length, rather than at one particular point, as a gully does. Most are variations on the theme of an enclosed channel, typically with a u-shaped cross-section and some form of grating over the top.

Channel drains are a type of rainwater drain which are installed underground, typically with a slotted grille to allow surface water to enter the drain. The water is then transported along the drain away from any areas where it may cause flooding or damage. Multiple drainage channels can be joined together with coupling to create surface water drainage systems of virtually any length. Channel drainage systems are discreet and tidy - the drainage system is hidden below ground and will enhance your property's infrastructure while maintaining a pleasing look.
