Catch Pits

A catch-pit is, essentially, an empty chamber with an inlet pipe and an outlet pipe set at a level above the floor of the pit. Any sediment carried by the system settles out whilst in the catch pit, from where it can be periodically pumped out or removed.

On filter/collector land drainage systems that have not used a geo-textile to minimise soil particle or sediment migration, a catch-pit should be considered preceding any outfall to a natural watercourse, to remove grits, silts and excess sediment.
