

Gullies

Gullies are a key part of stormwater drainage systems as they provide the means of getting the surface water to the pipes below the ground.

A gully system is generally made up of covers or grates, gully pots and connecting pipework leading down to the main drain. They are manufactured from high quality **HDPE**, are light and easy to handle and install, offering an ideal alternative to heavy concrete gullies for both road and smaller capacity requirements.

Aluminium silt buckets are available.

A range of iron gratings can be supplied to meet **BS EN 124** (Gully tops and manhole tops for vehicular and pedestrian area) loading criteria.

Diameter (mm)	Depth (mm)	Capacity (litres)	BS EN Coupling (mm)	Adaptors	Grating
300	600	24	110	✓	✓
450	750	80	160	✓	✓
450	900	104	160	✓	✓
